

Framework Selection Report

Project: Pangasinan Heritage Digital Showcase

My Choice

I chose React with Next.js 14. It helps me make reusable components and different pages. It also supports static pages for simple hosting.

Comparison

React with Next.js scored 4 for performance, 5 for developer speed, 5 for ecosystem, 4 for learning curve, 5 for component structure, 5 for documentation, and 5 for deployment. The average is 4.65 out of 5.

Vue with Nuxt scored 4 for performance, 4 for developer speed, 4 for ecosystem, 4 for learning curve, 5 for component structure, 4 for documentation, and 4 for deployment. The average is 4.15 out of 5.

Both options can work. React scored higher because it fits this project and has many learning resources.

Project Needs

The website needs to load fast, work on phones, be easy to update, be accessible, and be easy to deploy. It uses responsive CSS, reusable components, image alt text, a labeled search form, and static pages.

Deployment

Run `npm install` and `npm run dev` for development. Run `npm run build` for the final website. Next.js creates the files in the `out` folder.

BFF and Edge

I did not use BFF or edge computing. This project has no database, login, or live API, so they are not needed.
